

In-depth Transaction Monitoring across
Java, .Net & Ruby on Rails
environments using **APM Insight**

ManageEngine
Applications Manager

The key to effective application performance management is unmatched visibility into the way business applications behave for end users. With Applications Manager, you can ensure your revenue-critical web applications are performing well and meeting user satisfaction levels.

Deep-dive Performance Metrics – From URL to SQL

Gain deep visibility into the way your business applications perform. Detect slow transactions and resolve performance degradation issues regardless of the cause.

Transaction tracing – Pinpoint Performance bottlenecks

Get the exact invocation pattern and details related to an internal invocation of a transaction. Zoom in on bottlenecks fast, no matter where they occur.

Database Metrics – Gauge your database’s performance

Identify slow database calls, database usage and overall performance of the database. Find out more about the web transactions executed by a database and quickly isolate the root cause of the performance slowdown.

Troubleshoot Memory Leaks of production apps

Monitor the JVM and analyze thread dump of applications in production. Detect and troubleshoot memory leaks as and when it happens.

Apdex Scores - Measure End User Satisfaction Levels

Track the before-and-after effects of your optimization efforts. Ensure your app delivers a fabulous user experience and amplify user satisfaction levels.
